Coverage includes Ireland. Power consumption is a key limitation in many high-speed and high-data-rate electronic systems today, ranging from mobile telecom to portable and desktop computing systems, especially when moving to nanometer technologies. Ultra Low-Power Electronics and Design offers to the reader the unique opportunity of accessing in an easy and integrated fashion a mix of tutorial material and advanced research results, contributed by leading scientists from academia and industry, covering the most hot and up-to-date issues in the field of the design of ultra low-power devices, systems and applications. Containing the history, details of construction, source and mode of water supply, pumping machinery, distribution, consumption,

pressure, hydrant rental, revenue and expenses, cost and debt, etc., etc., of every water-works in the United States and Canada, with summaries for each state and group of states; and directory of water-works officials, engineers and contractors. This book examines the production, procurement and marketing aspects of the organic produce sector with the focus on marketing agencies and producers in each commodity/product chain. It analyses the various institutional arrangements like contract farming, networking and producer level co-ordination prevalent in this sector. Based on case studies of various type of organic players in India, both in export market as well as in domestic market. An investigation has been conducted to determine the effects of decomposition-chamber size and catalyst-bed-material arrangement on the thrust buildup and decay time for a 90 percent hydrogen peroxide control rocket. The rocket produced about 35 pounds of static thrust at a chamber pressure of 300 pounds per square inch. Catalyst-bed loading ranged up to about 0.50 pound of propellant per second per square inch of bed. Five configurations, including two decomposition-chamber lengths and various arrangements of the catalytic material, were tested on a static test stand at various chamber pressures and rocket-case temperatures. Chamber-pressure-buildup time was mainly dependent upon rocket-

case temperature, being long at low temperatures and decreasing to about 0.05 second for rocket-case temperatures equal to or greater than 1,000 F. Variations in decomposition-chamber arrangement and steady-state chamber pressure produced little difference in the starting-time delay. Chamber-pressure-decay time to 10 percent of steady-state chamber pressure varied from about 0.06 to 0.11 second and the chamber pressure decayed completely in 0.08 to 0.20 second at all test conditions.
