The United States now spends approximately \$115 billion annually to perform its metal removal tasks using conventional machining technology. Of this total amount, about \$14 billion is invested in the aerospace and associated industries. It becomes clear that metal removal technology is a very important candidate for rigorous investigation looking toward improvement of productivity within the manufacturing system. To aid in this endeavor, work has begun to establish a new scientific and technical base that will provide principles upon which manufacturing decisions may be based. One of the metal removal areas that has the potential for great economic advantages is high-speed machining and related technology. This text is concerned with discussions of ways in which high-speed machining systems can solve immediate problems of profiling, pocketing, slotting, sculpturing, facing, turning, drilling, and thin-walled sectioning. Benefits to many existing programs are provided by aiding in solving a current management production problem, that of efficiently removing large volumes of metal by chip removal. The injection of new high-rate metal removal techniques into conventional production procedures, which have remained basically unchanged for a century, presents a formidable systems problem, both technically and man agerially. The proper solution requires a sophisticated, difficult process whereby management-worker relationships are reassessed, age-old machine deSigns reevaluated, and a new vista of product/process planning and design admitted. Reviews the mineral and material industries of the United States and foreign countries. Contains

statistical data on materials and minerals and includes information on economic and technical trends and development. Includes chapters on approximately 90 commodities and over 175 countries. This anthology, *Defining Public Administration*, is designed to assist beginning and intermediate level students of public policy, and to stir the imaginations of readers concerned with public policy and administration. The forty-five articles included in the text are all reprinted from the *International Encyclopedia of Public Policy and Administration*, and these accessible, interesting articles have been assembled to offer a sample of the riches to be found within the larger work. The articles provide definitions of the vocabulary of public policy and administration as it is used throughout the world—from the smallest towns, to the largest national bureaucracies. *Defining Public Administration* is organized into twelve parts. Each part focuses on a domain pertinent to the study of public administration, including overviews, policy making, intergovernmental relations, bureaucracy, organization behavior, public management, strategic management, performance management, human resource management, financial management, auditing and accountability, and ethics. This revised, updated second edition provides an accessible, practical overview of major areas of technical development and clinical application in the field of neurorehabilitation movement therapy. The initial section provides a rationale for technology application in movement therapy by summarizing recent findings in neuroplasticity and motor learning. The following section then explains the state of the art in human-machine interaction requirements for clinical rehabilitation practice. Subsequent sections describe the ongoing revolution in robotic therapy for upper extremity movement and for walking, and then describe other emerging technologies including electrical stimulation, virtual reality, wearable sensors, and brain-computer interfaces. The promises and limitations of these technologies in neurorehabilitation are discussed. Throughout the book the chapters provide detailed practical information on state-of-the-art clinical applications of these devices following stroke, spinal cord injury, and other neurologic disorders. The text is illustrated throughout with photographs and schematic diagrams which serve to clarify the information for the reader. *Neurorehabilitation Technology, Second Edition* is a valuable resource for neurologists, biomedical engineers, roboticists, rehabilitation specialists, physiotherapists, occupational therapists and those training in these fields. Vols. for include annually an issue with title: *Textile industries buyers guide*. The dairy sector continues to be at the forefront of innovation in food processing. With its distinguished editor and international team of contributors, *Dairy processing: improving quality reviews key developments and their impact on product safety and quality*. The first two chapters of part one provide a foundation for the rest of the book, summarising the latest research on the constituents of milk and reviewing how agricultural practice influences the quality of raw milk. This is followed by three chapters on

key aspects of safety: good hygienic practice, improvements in pasteurisation and sterilisation, and the use of modelling to assess the effectiveness of pasteurisation. A final sequence of chapters in part one discuss aspects of product quality, from flavour, texture, shelf-life and authenticity to the increasingly important area of functional dairy products. Part two reviews some of the major technological advances in the sector. The first two chapters discuss developments in on-line control of process efficiency and product quality. They are followed by chapters on new technologies to improve qualities such as shelf-life, including high pressure processing, drying and the production of powdered dairy products, and the use of dissolved carbon dioxide to extend the shelf-life of milk. Part three looks in more detail at key advances in cheese manufacture. Dairy processing: improving quality is a standard reference for the dairy industry in improving process efficiency and product quality. Reviews key developments in dairy food processing and their impact on product safety and quality Summarises the latest research on the constituents of milk and reviews how agricultural practice influences the quality of raw milk Outlines the key aspects of safety: good hygienic practice, improvements in pasteurisation and sterilisation, and the use of modelling to assess the effectiveness of pasteurisation This book helps readers "understand "how the components of textiles--fiber, yarn, fabric, dye, and finish--contribute to the performance of products for specific end uses. With a focus on the "why" behind the material, it encourages students to understand and predict textile properties and performance. This edition emphasizes the global environment and offers separate chapters in fiber properties; fabrics and structures; and nonwoven fabrics. Finishes are now separated into two chapters (physical/mechanical finishes and chemical finishes) and "Take a Closer" look sections bring an in-depth perspective to select chapter topics. This book is a guide to trademarks for the layman. The choosing of the right mark, how to use the trademark and register it, administering trademarks within a company, policing a trademark, licensing and franchising, and other trademark issues are covered in the book.
